

\$1,384 a month out.
\$609 into your own retirement.

Parents supporting an adult child hand over an average of \$1,384 a month. The average working parent puts \$609 into their own retirement.

This is not a book about pressuring them to leave. The research on controlling approaches is genuinely bad — overparenting is associated with reduced self-efficacy, which is the exact capacity required to move out. You can make this worse by trying harder.

It is a book about help that builds capability instead of dependency, and how to tell which one you are giving.

- What their support is actually costing your retirement
- How to open the conversation without a fight
- The written agreement, and "shadow rent"
- Gift, loan, or match — and which one works
- Cosigning: the full risk, stated plainly
- What to do if they move back (40–60% do)

Every figure in this book is cited. Built on 218 sources from HUD, the CFPB, the FTC, the Bureau of Labor Statistics, the USDA, the Harvard Joint Center for Housing Studies and peer-reviewed research — including a section on where the evidence is weaker than the popular claim.

PARENT EDITION

The Move-Out Blueprint

How to help your adult child leave without funding it forever

Help that builds capability, help that creates dependency, and how to tell which one you're giving.
